SECUDE

SECUDE's solution offering:

FinallySecure Enterprise is a Full Disk Encryption solution that enables you to be compliant with data protection laws and regulations. The solution offers strong user authentication even before the boot-up process. Also, users can authenticate through the optional use of smart cards or digital certificates, thus making their laptops truly secure. FinallySecure Enterprise encrypts the entire content in your laptop's hard disk, thus safeguarding your organization from potential financial loss and consequential legal issues even if the computer falls into wrong hands.

DevicePro ensures that business-sensitive data never illegally leaves the organization's network on an external storage device such as a USB stick or external hard drive. This solution ensures that only authorized storage media is used by authorized users.

SecureFolder Enterprise is a transparent folder encryption solution that enables the encryption of files and directories in enterprise level networks. The integration of IDM (Identity Management) and ECM (Enterprise Content Management) systems allows the solution to automatically implement policies and to operate through a centralized security management console.

CryptionPro encrypts data that is copied to external storage media. This happens automatically and reliably in the background without disrupting the user's work.

ApplicationPro controls applications based on either a whitelist or a blacklist filter.

Centralized Management

All SECUDE solutions can be configured and managed through a centralized management console. This ability allows the administrator to define configurations, centrally distribute security policies and monitor compliance. The management console provides remote configuration, remote decommissioning, an intuitive interface and synchronization with Microsoft Active Directory™.
